# Load Activities Process:

1. Reads the files from dataLake cleansed path and builds a batch id in kebab case (customer-sourceType-batchName) Eg: chomp-utilization-2017-09, experian-prospect-standard-2017-09
2. For all the data sources *except* Experian, it uses all of the records from parquet files. But for Experian, filters all the records whose zip5 exists in customer's servicing areas.
3. Deletes prior existing data for the given customer and batchId and saves the cleansed activities dataFrame from step 2 based on batchId and customer.
